

I am building a fun classroom reward system for kids. The app should be a single colorful web page with student avatars arranged in a grid. Each avatar shows the student's name below it. Main features:

- Click any student's avatar to select them
- Have three reward buttons: +1 point, +2 points, and +3 points
- Have a Sad Face button for behavior correction
- When points are given, the student's avatar should show a fun animation and play a happy sound
- When a sad face is given, it shows a sad face icon on their avatar with a different sound
- Show a live leaderboard on the side or top that ranks students by their total points

- All data must save automatically using localStorage so it doesn't disappear when I refresh the page

- The design should be bright, colorful, and appealing to children

The sad face is only for the current class. It does not carry over to the next class. It is simply a visual warning for that lesson. Please build this as a clean static website using this exact folder structure: index.html, style.css, script.js, students.js, with separate assets/images and assets/sounds folders. It needs to be easy to host on Vercel. Make the code well-commented and organized so I can easily update it later.
